

QUALITY CONTROL FOR END PRODUCT - RUBBER

As a processor of rubber bales or the user of rubber bales, metal contamination in your product is a constant worry. The use of a metal detector can help to ensure that your product is protected from metal contamination. It can be placed in-line after the pressing of the bales so the any contaminated product can be removed before packing. This will ensure that the final product is clean of metal contamination.

SARTORIUS Metal Detector is used in a number of rubber bales processing factories in Malaysia, Thailand and also in Indonesia.
