

VISUAL INSPECTION CONVEYOR

Visual inspection of products can be achieved much easier with the use of a Vibratory Inspection Conveyor. Enmin have developed a conveyor that overcomes the problems with conventional flat belt inspection conveyors.

Inspection of products such as Dried Fruits, Confectionery, Snack Bars or Edible Nuts can be tedious task and subject to inefficiencies. Using an Enmin Vibratory Inspection Conveyor almost all the issues are overcome. Since Vibratory Conveyors provide a “live bed” the individual product pieces will automatically spread themselves out and in many cases rotate the pieces giving a differing visual. Damaged or spoilt pieces are easier to spot by the operators. The Live Bed can be changed by a simple hand movement from the operator making removal of the reject pieces easy. In places where Optical or Automatic Reject systems are employed, the activated moving bed created by the Vibratory Inspection Conveyor will always increase the efficiency of the system.

Enmin Vibratory Inspection Conveyors provide a quiet safe environment. Designed and constructed to HACCP requirements. Cleaning of the equipment simply requires a wipe down since all surfaces are in stainless steel. Speed of the conveyor is controlled and a special reject system ensures all rejected product is collected at one point. The conveyors can be mobile, incorporate an operator platform and made in lengths from 2 metres to 5 metres long with a variety of widths to suit where single or dual positioned inspectors are stationed.
